

To state the obvious :

- STFC's National Laboratories are not defence labs, and therefore the infrastructure and expertise are neither defence specific, nor are they optimised for defence S&T priorities.
- However, they are exceptionally flexible, and it is entirely possible that they might be relevant to project proposals you develop.

In outline

- A wide variety of radiation sources :
 - Notably but not exclusively Diamond SRS, ISIS, CLF, e-beam ;
 - Structural characterisation over a variety of length and time scales.
- Detector technologies :
 - Design, fabrication, testing.
- “Ancillary” disciplines :
 - e.g. control systems, systems engineering, cryogenics
- Accommodation for experiments employing your own radiation sources.
- Computing (including various codes).
- People as well as infrastructure :
 - experts in their fields, often with extensive networks into the wider community ;
 - Help and assistance in finding potential collaborators.
